In this series of interviews held by Rede Globo de Televisão, Dr. Drauzio Varella talks about a constant and current problem that happens at alarming rates in the Public Health in Brazil and all over the world. The production particularly evidences those problems related to varices, a disease that could cause many complications to the individuals. This disease is culturally neglected by the very patients, but it is so common that it currently affects 70% of the adult population – in a higher (venous ulcer) or lower degree. The interview also broaches issues of public policies, since the varices are a source of high cost for the government and of great suffering for those who conceal them.
